Re: Iroquois Gas Transmission System, LP
Enhancement By Compression (ExC) Project
Air State Facility Permit ID Nos. 3-1326-00211 and 4-1922-00049

Dear Ms. Gaidasz:

Enclosed please find Iroquois Gas Transmission System, L.P.'s responses to Questions 4 through 6 of the New York State Department of Environmental Conservation's March 5, 2021 Request for Additional Information related to the above-referenced Air State Facility permit Applications for the Enhancement by Compression ("ExC") Project.

Feel free to contact me if you have any questions or require additional information.

IROQUOIS GAS TRANSMISSION SYSTEM, L.P.
By its Agent
Iroquois Pipeline Operating Company

Title: Director, Engineering Services

Response to NYSDEC March 5, 2021 Request for Additional Information
Iroquois Gas Transmission System, LP
Enhancement By Compression (ExC) Project
Air State Facility Permit ID Nos. 3-1326-00211 and 4-1922-00049

Below are Iroquois Gas Transmission System, L.P.'s ("Iroquois") responses to Question Nos 4 through 6 of New York State Department of Environmental Conservation's ("DEC") March 5, 2021 Requests for Additional Information ("RFAI")[1] related to Iroquois' applications for modifications of the Air State Facility Permits (the "Applications")[2] for Iroquois' Athens Compressor Station (DEC ID No. 4-1922-00049) and Dover Compressor Station (DEC ID No. 3-1326-00211) related to the proposed Enhancement by Compression Project (the "ExC Project" or the "Project").

For convenience, set forth below are Question Nos. 4 through 6 of the RFAI followed by Iroquois' response.

Question No. 4:

The emissions calculations state that the emissions are emission rate potential numbers (ERPs) based on uncontrolled firing of the equipment. There is no basis for these numbers. Iroquois must provide the following emission tables instead of what was submitted (Note: NYSDEC staff found discrepancies in the emission totals and these tables are intended to clarify these discrepancies):

I. A table with the current potential to emit of the existing sources at the facility (controlled, if there are controls) with any permitted restrictions listed (e.g., hours per year of operation or fuel amount limits).
II. A table (i.e., project emissions summary table) with the potentials to emit for all the new sources (based on any proposed operational or time restrictions).
III. A table with the total facility potential to emit (this includes the existing source emissions plus the new source emissions).

Response:

Three emission tables (Tables 1-3 listed below) are provided with this response for each of the Applications. Each table quantifies potential to emit from existing sources, new sources, and total combined post-Project existing (as modified) and new sources. The tables identify any operational restrictions and controls.

[1] DEC sent one RFAI to Iroquois for each of the Air State Facility Permit Applications. Since the RFAI questions were identical for both Applications, this document includes Iroquois' response to both RFAI. Iroquois is continuing to evaluate RFAI Questions Nos. 1 through 3.
[2] The Applications, as supplemented, and this response have been filed with DEC without prejudice to any rights that Iroquois now has, may have, or which it seeks to assert in the future under the Natural Gas Act (15 U.S.C. § 717 et seq.), all of which are hereby expressly reserved.

- Table 1 – Potential to Emit Tons per Year
- Table 2 – Potential to Emit Pounds per Year
- Table 3 – Potential to Emit Pounds per Hour

Some of the potential to emit values and some of the emission rate potential values have been updated in the tables and on the associated air permit application forms. Values revised on the application forms are identified with adjacent red markings.

The revised application forms and tables for the Athens Compressor Station and Dover Compressor Station are attached to this response as Attachment A and Attachment B, respectively.

Question No. 5:

The ASF application states that the heat content of the fuel is required to meet 1032 Btu/scf heat content as per the New Source Performance Standards (NSPS) Subpart KKKK requirements. However, there are multiple occurrences in the application and emission calculations that cite a fuel heat content of 1016 Btu/scf as well as 1031.7 Btu/scf heat content. It is NYSDEC staff's assumption that the natural gas coming into the station will have the same heat content when burned in any of the emission sources at the facility (both new and existing). Therefore, one heat content value should be used for all the emissions calculations. Please note that while the new turbine may be the only source that has to meet the NSPS requirement of a minimum heat content, all of the potential emissions from the entire facility must be calculated using this minimum heat content of 1032 Btu/scf.

Response:

Iroquois adjusted its natural gas fuel composition for its existing sources to match that of its new sources (i.e., 1,031.7 Btu/scf). In addition to the fuel's heat content, the fuel's volatile organic compound and sulfur contents are now also uniform for all sources. Seven of the application form pages have been amended as a result of the adjustment to those values and are attached with this response. Red markings have been added to the application forms to identify revised emissions values. If DEC would like the remainder of the application package included with the amended pages, Iroquois will provide that upon request.

The New Source Performance Standards applicable to Iroquois' proposed natural gas combustion turbines do not include a minimum or maximum fuel heat content limit or threshold. Rather, Iroquois complies by meeting a sulfur dioxide emissions limit. The statements in the permit application Section III, "Facility Compliance Certification", "Compliance Activity Description", on application package Page 5, and in Section IV, "Emission Unit Compliance Certification", "Compliance Activity Description", on Page 12, have been revised and clarified to read as follows.

Iroquois will comply with its Federal Energy Regulatory Commission natural gas tariff delivery point sulfur content limit (currently 1.25 gains per 100 Scf) at the compressor station. As a result, the turbines will not burn fuel emitting potential sulfur emissions in excess of the New Source Performance Standards (40 CFR Subpart KKKK) limit of 0.06 pounds of sulfur dioxide per million Btus of fuel heat input, which is equivalent to 21 grains of sulfur per 100 Scf.

Question No. 6:

The application does not contain a map showing the locations of Potential Environmental Justice Areas (PEJAs) within the vicinity of the ExC Project. Please provide a project map which has an overlay of New York PEJAs.

Response:

Attachment C to this response includes figures showing the locations of the Athens Compressor Station, Dover Compressor Station and Potential Environmental Justice Areas.

Section IV - Emission Unit Information

Emission Unit Description ☐ Continuation Sheet(s)

Emission Unit: 3-00001

The entire natural gas pipeline compressor station is the emission unit. It includes a single existing, natural gas-fired combustion turbine and compression facilities for delivery to downstream customers. The proposed project would add a second approximately 12,000 maximum horsepower (HP) rated simple-cycle low NOx natural gas fueled combustion turbine with an oxidation catalyst to drive a natural gas pipeline compressor.
The station also includes an existing permit-exempt 750 HP reciprocating, natural gas-fired, emergency generator, to which an oxidation catalyst will be added, and two other small natural gas combustion sources (heaters) that are exempt from air permitting (i.e., less than 10 million Btus/Hour fuel input rating).

Compliance Activity Description

Iroquois will comply with its Federal Energy Regulatory Commission natural gas tariff delivery point sulfur content limit (currently 1.25 gains per 100 Scf) at the compressor station. As a result, the turbines will not burn fuel emitting potential sulfur emissions in excess of the New Source Performance Standards (40 CFR Subpart KKKK) limit of 0.06 pounds of sulfur dioxide per million Btus of fuel heat input, which is equivalent to 21 grains of sulfur per 100 Scf.

Section IV - Emission Unit Information

Emission Unit Description ☐ Continuation Sheet(s)

Emission Unit: 5-00001

The entire natural gas pipeline compressor station is the "emission unit". It includes a single existing, natural gas-fired simple-cycle combustion turbine and compression facilities to boost natural gas pressure in the pipeline for delivery to customers. The proposed project would add a second approximately 12,000 horsepower (HP) maximum rated simple-cycle low NOx natural gas fueled combustion turbine with an oxidation catalyst to drive a second natural gas pipeline compressor. The project also would replace the existing permit-exempt 750 HP reciprocating, natural gas-fired, emergency generator engine with a similar new permit-exempt lean burn EPA-certified approximately 1,500 HP emergency engine with CO oxidation catalyst. The facility would maintain two existing small natural gas combustion sources (heaters) that are exempt from air permitting (i.e., less than 10 million Btus/Hour fuel input rating).
